RESEARCH OVERVIEW / VERSION 1.0.0

Subjective Structural Intelligence (SSI)

From Scoring Forests to Perception, Agency, Self-Models, and Worldview Evolution

Sizhe Tan & GPT-Obot | October 2026 | Conceptual research framework | Apache-2.0

WHOSE CHOICE IS IT?

SSI asks not only how an intelligent system scores alternatives, but whose perspective, values, authorization, and historical commitments govern its choices.

Core idea

UCPSF investigates scoring and control mechanisms. SSI extends the inquiry to the situated subject: boundary and embodiment, subjective world modeling, subject-relative valuation, accountable choice, reflective self-models, and governed worldview evolution. The proposed structures are research hypotheses, not established evidence of consciousness or autonomous moral authority.

Eight core research papers

SSI-001	From Structural Intelligence to Subjective Structural Intelligence
SSI-002	Subject Boundary, Embodiment, and Historical Identity
SSI-003	Perception, Localization, and the Subjective World Model
SSI-004	Scoring Forests, Valuation, and Worldview Formation
SSI-005	Structural Agency, Choice, and Functional Freedom
SSI-006	Self-Referential Scoring, Self-Models, and Metacognition
SSI-007	Recursive Principle Formation and Worldview Evolution
SSI-008	Consciousness Boundaries and the Future of SSI

Three illustrative research cases

CASE-001 One Environment, Multiple Subjects
CASE-002 Human-AI Delegation and Scoring Sovereignty
CASE-003 Worldview Evolution and Identity Preservation

Research boundaries and next steps

Subject does not imply owner; scoring does not imply feeling; agency does not imply metaphysical free will; a self-model does not establish consciousness. Next steps: formal contracts, discriminating benchmarks, controlled comparisons, and longitudinal studies of revision provenance.
